

PRESS RELEASE

VC3 DELIVERS BEST GRADE TO DATE

Toronto, Ontario, April 6, 2005 – Wesdome Gold Mines Inc. is pleased to announce further results from underground drilling of the VC zone at the Company's wholly owned Kiena Mine Complex in Val d'Or, Québec. Fan drilling to the north (000° azimuth) on 15 metre sections has, to date, traced the zone for a strikelength of about 60 metres. It remains open to the west and is thinning towards the east. Results tabulated below are from section 13215E, the easternmost to date drilled from the 520 metre level. Previous results are summarized in press releases dated December 15, 2004; January 19, 2005; February 16, 2005 and March 4, 2005.

SECTION 13215E

Hole #	Dip (°)	Significant Intersections							Zone
		From (m)	To (m)	Corelength (m)	True Width (m)	Assay (g/t)	Cut Assay (g/t) *

The VC zone consists of an en-echelon series of at least three mineralized zones which to date have been traced downdip for over 500 metres and remain open at depth. Mineralization consists of silicified and albitized breccia hosted in basalt within a basalt-komatiite sequence cut by minor intermediate to felsic intrusive bodies. At least one more section will be completed to the east. The drill will be moved to the 388 zone and the drilling drift will be extended west to allow drilling to follow up on results from Section 13170E which included intersections of 29.5 metres of 4.28 gAu/tonne, 29.4 metres of 6.01 gAu/tonne and 10.1 metres of 7.0 gAu/tonne in the VC2 zone and intersections of 9.4 metres of 9.72 gAu/tonne, 16.8 metres of 13.27 gAu/tonne, 18.0 metres of 8.17 gAu/tonne, 30.0 metres of 6.30 gAu/tonne and 35.6 metres of 6.72 gAu/tonne in the VC3 zone (see press release dated February 16, 2005).

Wesdome is conducting an aggressive underground exploration and development program with the goal of commencing commercial production as soon as possible. Results will be updated on a regular basis.

Assay work is conducted by commercial facility Bourlamaque Assay Laboratories in Val d'Or, Quebec, employing conventional fire assay techniques on one assay ton sample aliquots. Core samples with visible gold are analyzed by metallic sieve methods on 500 gram aliquots. George Mannard, P.Geo. and "Qualified Person" as per NI 43-101 has prepared and verified the content of this release.

Wesdome Gold Mines Inc. trades on the TSX-V Exchange under the symbol "WDG" and has 43.5 million common shares outstanding.
